Introduction

Definition 1. Magma Magma is a set G equipped with a binary operation $\circ: G \times G \to G$.

A law is an equation involving a finite number of indeterminate variables and the operation \circ . A magma G then obeys that law if the equation holds for all possible choices of indeterminate variables in G. For instance, the commutative law

$$x \circ y = y \circ x$$

holds in a magma G if and only if that magma is abelian.

We will be interested in seeing which laws imply which other laws, in the sense that magmas obeying the former law automatically obey the latter. We will also be interested in *anti-implications* showing that one law does *not* imply another, by producing examples of magmas that obey the former law but not the latter.

Equations

Definition 2 (Equation 1). Equation 1 magma-def Equation 1 is the law x = x.

Definition 3 (Equation 2). Equation 2 magma-def Equation 2 is the law x = y.

Definition 4 (Equation 3). Equation 3 magma-def Equation 3 is the law $x = x \circ x$.

Definition 5 (Equation 4). Equation 4 magma-def Equation 4 is the law $x = x \circ y$.

Definition 6 (Equation 5). Equation5magma-def Equation 5 is the law $x = y \circ x$.

Definition 7 (Equation 6). Equation 6 magma-def Equation 6 is the law $x = y \circ y$.

Definition 8 (Equation 7). Equation 7 magma-def Equation 7 is the law $x = y \circ z$.

Definition 9 (Equation 8). Equation8magma-def Equation 8 is the law $x = x \circ (x \circ x)$.

Definition 10 (Equation 38). Equation 38 magma-def Equation 38 is the law $x \circ x = x \circ y$.

Definition 11 (Equation 39). Equation 39 magma-def Equation 39 is the law $x \circ x = y \circ x$.

Definition 12 (Equation 40). Equation 40 magma-def Equation 40 is the law $x \circ x = y \circ y$.

Definition 13 (Equation 41). Equation 41 magma-def Equation 41 is the law $x \circ x = y \circ z$.

Definition 14 (Equation 42). Equation 42 magma-def Equation 42 is the law $x \circ y = x \circ z$.

Definition 15 (Equation 43). Equation 43 magma-def Equation 43 is the law $x \circ y = y \circ x$.

Definition 16 (Equation 46). Equation 46 magma-def Equation 46 is the law $x \circ y = z \circ w$.

Definition 17 (Equation 168). Equation 168 magma-def Equation 168 is the law $x = (y \circ x) \circ (x \circ z)$.

Definition 18 (Equation 387). Equation 387 magma-def Equation 387 is the law $x \circ y = (y \circ y) \circ x$.

Definition 19 (Equation 4512). Equation 4512 magma-def Equation 4512 is the law $x \circ (y \circ z) = (x \circ y) \circ z$.

Definition 20 (Equation 4513). Equation 4513 magma-def Equation 4513 is the law $x \circ (y \circ z) = (x \circ y) \circ w$.

Definition 21 (Equation 4522). Equation 4522 magma-def Equation 4522 is the law $x \circ (y \circ z) = (x \circ w) \circ u$.

Definition 22 (Equation 4582). Equation 4582 magma-def Equation 4582 is the law $x \circ (y \circ z) = (w \circ u) \circ v$.

Implications

To reduce clutter, trivial or very easy implications will not be displayed here.

Theorem 23 (387 implies 43). $eq387, eq43Equation387 implies_Equation43Definition??impliesDefinition??.$

Proof. (From MathOverflow). By Definition ??, one has the law

$$(x \circ x) \circ y = y \circ x. \tag{3.1}$$

Specializing to $y = x \circ x$, we conclude

$$(x \circ x) \circ (x \circ x) = (x \circ x) \circ x$$

and hence by another application of (??) we see that $x \circ x$ is idempotent:

$$(x \circ x) \circ (x \circ x) = x \circ x. \tag{3.2}$$

Now, replacing x by $x \circ x$ in (??) and then using (??) we see that

$$(x \circ x) \circ y = y \circ (x \circ x)$$

so in particular $x \circ x$ commutes with $y \circ y$:

$$(x \circ x) \circ (y \circ y) = (y \circ y) \circ (x \circ x). \tag{3.3}$$

Also, from two applications of (??) one has

$$(x \circ x) \circ (y \circ y) = (y \circ y) \circ x = x \circ y.$$

Thus (??) simplifies to $x \circ y = y \circ x$, which is Definition ??.

Theorem 24 (7 equivalent to 2). eq2, eq7Equation7_implies_Equation2, Equation2_implies_Equation7Definition

Proof. When x = y * z, obviously x = y because x = x * x and y = x * x. the other way around is trivial.

Theorem 25 (6 equivalent to 2). $eq2, eq6Equation6, mplies_Equation2, Equation 2)$	$ation 2_i mplies_E quation 6 Definition$
<i>Proof.</i> Similar to the previous argument.	
More generally, any equation of the form $x = f(y, z, w, u, v)$ is equivalent Equation 2 (eventually once we have enough API for Magma relations, we conformalize this general claim rather than establish it on a case by case basis	ould

is also trivial that Equation 2 implies every other equation.

Counterexamples
